

Quick Connections

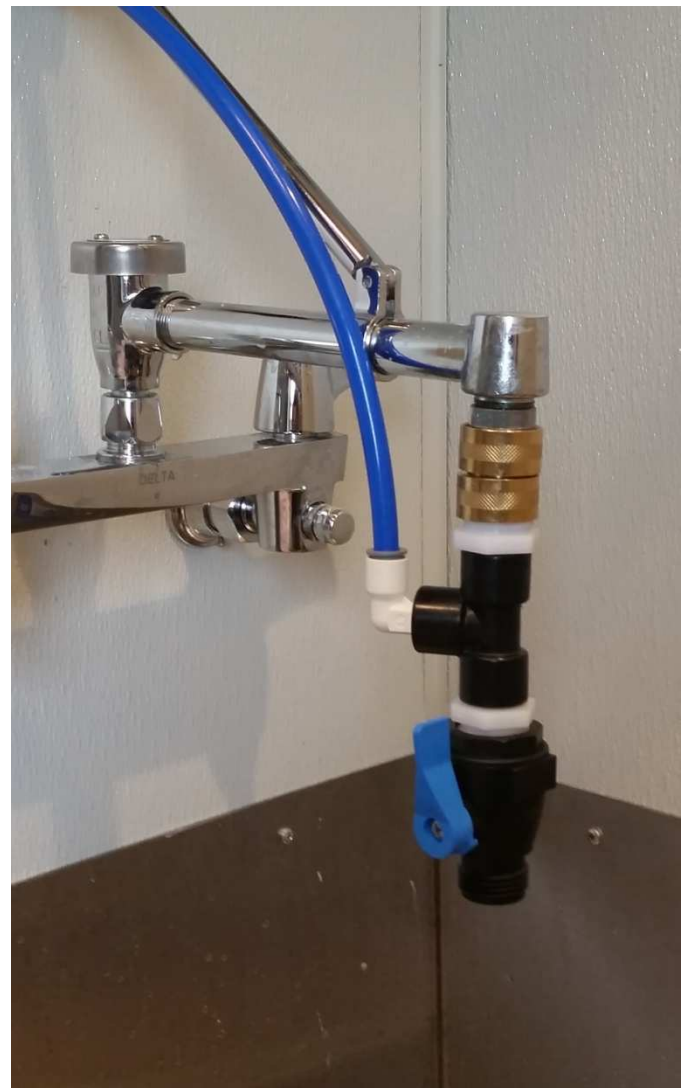

Cut Away View

This appliance allows the end user to create a customized supply line for their wall mounted dilution unit, or units. Having the option of cutting the supply line to a specified length, and bend it specific configurations will allow them to simplify the water line to something compact (space saving)

This fitting and tubing technology is rated way beyond the typical water supply pressure, so the end user can install this highly efficient diverter unit with confidence. Simply install the dilution unit near your water source... install the diverter, then bend the tubing into the desired shape and cut it off squarely. Push each end into the diverter as well as the supplied adapter, then attach it to your dilution unit. Turn on the water and check for any leaks.

The length of tubing can be secured to nearby fixtures, or even the wall (with supplied mounting ties)
